

IN THE FIGHT AGAINST AIR POLLUTION, STEEL PLAYS A CRUCIAL ROLE.

Steel is the predominant construction material in future mobile transport and **renewable energy generation technologies** such as wind turbines, solar panels and electric vehicles.

Steel also features as a construction material for air pollution abatement equipment such as electrostatic precipitators, baghouses and cyclones.

As one of the most important construction and automotive materials of the past and present, steel is set to play a significant role towards a more environment-friendly future.

WORLD ENVIRONMENT DAY 5 JUNE 2019
